The Chemistry of Carbon

Organic chemistry is the study of all compounds that contain bonds between carbon atoms.

Carbon atoms have four valence electrons that can join with the electrons from other atoms to form strong covalent bonds.

A carbon atom can bond to other carbon atoms, giving it the ability to form chains that are almost unlimited in length.

Slide 3 of 37

Copyright Pearson Prentice Hall

Living organisms are made of molecules that consist of carbon and other elements.

Chains of carbon can even close upon themselves to form rings.

Carbon has the ability to form millions of different large and complex structures.

Slide 4 of 37 2–3 Carbon Compounds 📫 Macromolecules

Macromolecules

Macromolecules are formed by a process known as polymerization.

The smaller units, or **monomers**, join together to form **polymers**.

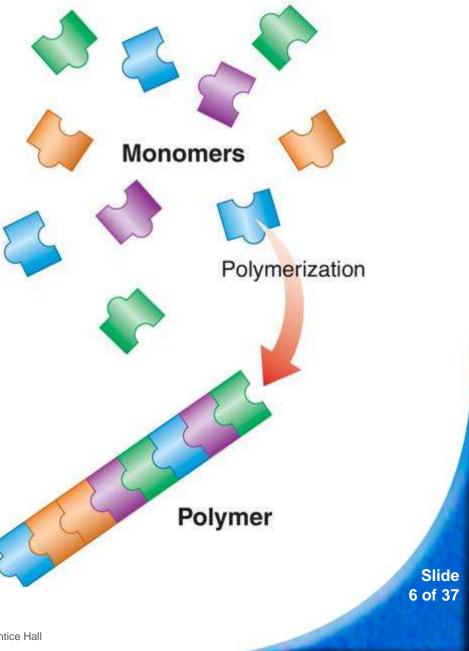

Copyright Pearson Prentice Hall

Slide 5 of 37

2–3 Carbon Compounds 📫 Macromolecules

Monomers in a polymer may be identical, or the monomers may be different.

2–3 Carbon Compounds 📫 Macromolecules

Four groups of organic compounds found in living things are:

- carbohydrates
- lipids
- nucleic acids
- proteins

2–3 Carbon Compounds 🕩 Carbohydrates

Carbohydrates

Carbohydrates are compounds made up of carbon, hydrogen, and oxygen atoms, usually in a ratio of 1 : 2 : 1.

Slide 9 of 37 2–3 Carbon Compounds 🛶 Carbohydrates

Living things use carbohydrates as their main source of energy. Plants and some animals also use carbohydrates for structural purposes.

> Slide 10 of 37

2–3 Carbon Compounds 🛸 Carbohydrates

The breakdown of sugars, such as glucose, supplies immediate energy for all cell activities.

Living things store extra sugar as complex carbohydrates known as starches.

Slide 11 of 37 2–3 Carbon Compounds 🕩 Carbohydrates

PEARSON Prentice Hall

Starches and sugars are examples of carbohydrates that are used by living things as a source of energy.

2–3 Carbon Compounds 📫 Carbohydrates

Single sugar molecules are called **monosaccharides**.

Monosaccharides include glucose, galactose (a component of milk), and fructose (found in many fruits).

The large macromolecules formed from monosaccharides are called **polysaccharides**.

Slide 13 of 37 2–3 Carbon Compounds 🛶 Lipids

Lipids

Lipids are generally not soluble in water.

Lipids are made mostly from carbon and hydrogen atoms.

Copyright Pearson Prentice Hall

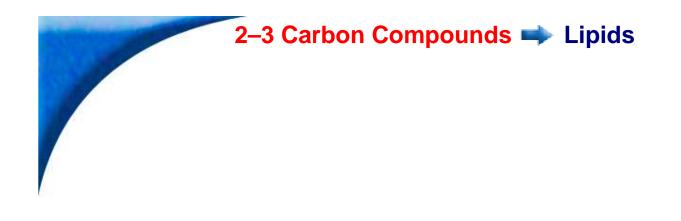

Slide 14 of 37 2–3 Carbon Compounds 📫 Lipids

The common categories of lipids are:

- fats
- oils
- waxes
- steroids

Slide 15 of 37

Slide 16 of 37 2–3 Carbon Compounds 📥 Lipids

Lipids can be used to store energy. Some lipids are important parts of biological membranes and waterproof coverings.

Copyright Pearson Prentice Hall

Slide 17 of 37 Many lipids are formed when a glycerol molecule combines with compounds called fatty acids.

If each carbon atom in a lipid's fatty acid chains is joined to another carbon atom by a single bond, the lipid is said to be saturated.

The term *saturated* is used because the fatty acids contain the maximum possible number of hydrogen atoms.

Slide 18 <u>of 37</u> If there is at least one carbon-carbon double bond in a fatty acid, it is unsaturated.

Lipids whose fatty acids contain more than one double bond are polyunsaturated.

Lipids that contain unsaturated fatty acids tend to be liquid at room temperature.

Slide 19 <u>of 37</u> 2–3 Carbon Compounds 🕩 Nucleic Acids

Nucleic Acids

Nucleic acids are macromolecules containing hydrogen, oxygen, nitrogen, carbon, and phosphorus.

Nucleic acids are polymers assembled from individual monomers known as <u>nucleotides</u>.

Copyright Pearson Prentice Hall

Slide 20 of 37 2–3 Carbon Compounds 🕩 Nucleic Acids

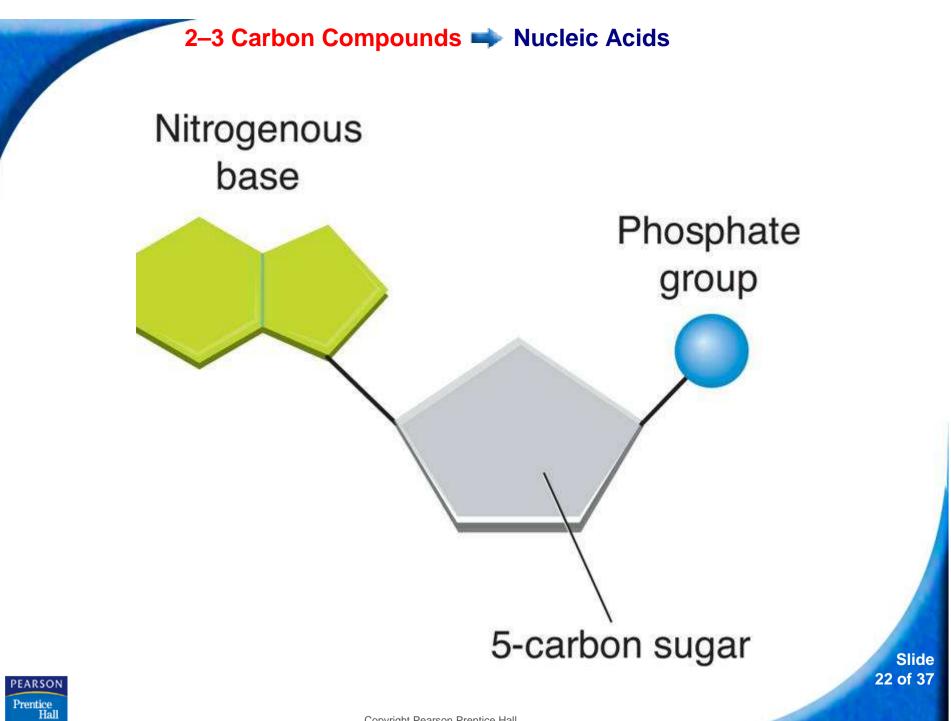

Nucleotides consist of three parts:

- a 5-carbon sugar
- a phosphate group
- a nitrogenous base

Individual nucleotides can be joined by covalent bonds to form a polynucleotide, or nucleic acid.

Slide 23 of 37 2–3 Carbon Compounds 🗪 Nucleic Acids

Nucleic acids store and transmit hereditary, or genetic, information.

There are two kinds of nucleic acids, **ribonucleic acid** (RNA) and **deoxyribonucleic acid** (DNA).

RNA contains the sugar ribose.

DNA contains the sugar deoxyribose.

Slide 24 of 37 2–3 Carbon Compounds 🕩 Proteins

Proteins

Proteins are macromolecules that contain nitrogen, carbon, hydrogen, and oxygen.

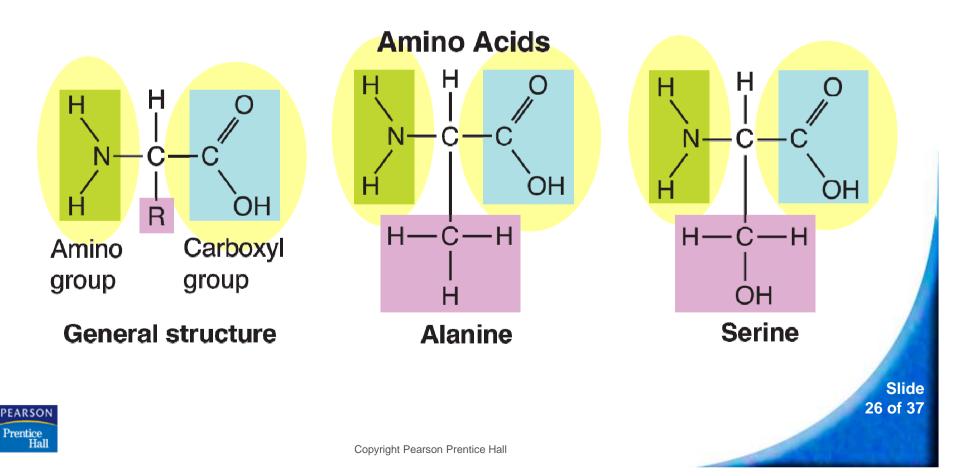

Proteins are polymers of molecules called **amino acids**.

Copyright Pearson Prentice Hall

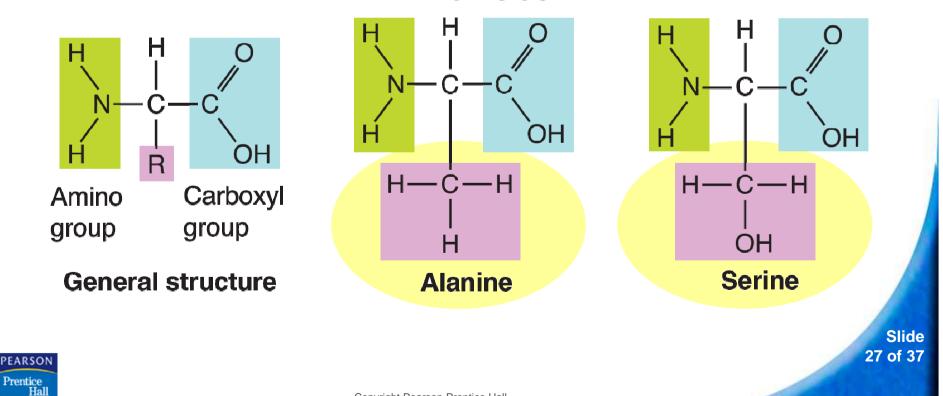

Slide 25 of 37 2–3 Carbon Compounds 📫 Proteins

Amino acids are compounds with an amino group $(-NH_2)$ on one end and a carboxyl group (-COOH) on the other end.

2–3 Carbon Compounds **Proteins**

The portion of each amino acid that is different is a side chain called an R-group.

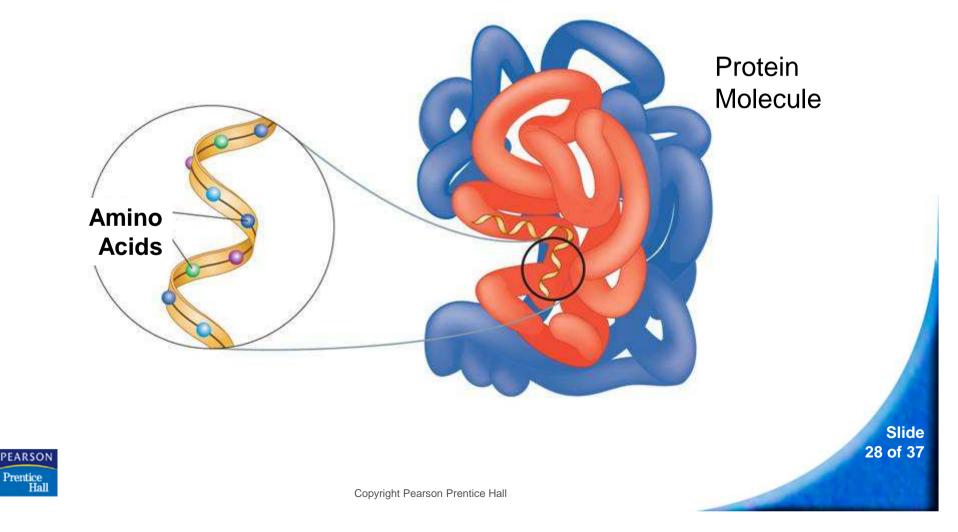

Amino Acids

Copyright Pearson Prentice Hall

2–3 Carbon Compounds 🕩 Proteins

The instructions for arranging amino acids into many different proteins are stored in DNA.

Slide 29 of 37 2–3 Carbon Compounds **Proteins**

Some proteins control the rate of reactions and regulate cell processes.

Some proteins are used to form bones and muscles.

Other proteins transport substances into or out of cells or help to fight disease.

Slide 30 of 37

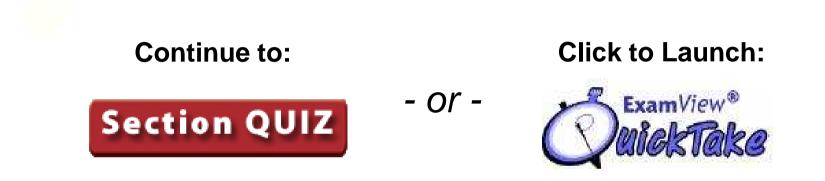

Proteins can have up to four levels of organization:

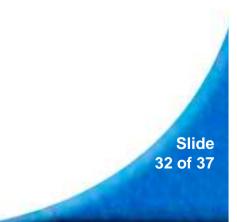

- 1. Amino acids have a specific protein chain.
- 2. The amino acids within a chain can be twisted or folded.
- 3. The chain itself is folded.
- 4. If a protein has more than one chain, each chain has a specific arrangement in space.

- 1 Large carbohydrate molecules such as starch are known as
 - a. lipids.
 - b. monosaccharides.
 - c. proteins.

A d. polysaccharides.

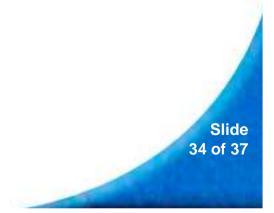

2 Many lipids are formed from glycerol and

A a. fatty acids.

- b. monosaccharides.
- c. amino acids.
- d. nucleic acids.

- 3 Proteins are among the most diverse macromolecules because
 - a. they contain both amino groups and carboxyl groups.

- b. they can twist and fold into many different and complex structures.
 - c. they contain nitrogen as well as carbon, hydrogen, and oxygen.
 - d. their R groups can be either acidic or basic.

Slide 35 of 37

PEARSON Prentice Hall

- 4 Which of the following statements about cellulose is true?
 - a. Animals make it and use it to store energy.
 - b. Plants make it and use it to store energy.
 - c. Animals make it and use it as part of the skeleton.

Slide 36 of 37

- 5 A major difference between polysaccharides and proteins is that
 - a. plants make polysaccharides, while animals make proteins.
 - b. proteins are made of monomers, while polysaccharides are not.
- A c. polysaccharides are made of monosaccharides, while proteins are made of amino acids.
 - d. proteins carry genetic information, while polysaccharides do not.
