An Ancient, Changing Earth

How did Hutton and Lyell describe geological change?

Copyright Pearson Prentice Hall

Slide 3 of 27

Hutton and Lyell helped scientists recognize that Earth is many millions of years old, and the processes that changed Earth in the past are the same processes that operate in the present.

> Slide 4 of 27

Hutton and Geological Change

In 1795, James Hutton published a hypothesis about the geological forces that shaped Earth.

Most of these geological forces operate very slowly, over millions of years.

Hutton proposed that Earth had to be much more than a few thousand years old.

Slide 5 of 27

Lyell's Principles of Geology

Lyell stressed that scientists must explain past events in terms of processes that they can actually observe.

The processes that shaped the Earth millions of years earlier continue in the present.

Slide 6 of 27

Lyell's work explained how geological features could be built up or torn down over long periods of time.

Copyright Pearson Prentice Hall

Slide 7 of 27

This understanding of geology influenced Darwin:

- If the Earth could change over time, life might change as well.
- It would have taken many years for life to change in the way Lyell suggested.

This would have been possible only if the Earth were extremely old.

According to Lamarck, how did species evolve?

Copyright Pearson Prentice Hall

Slide 9 of 27

Lamarck's Evolution Hypotheses

Jean-Baptiste Lamarck recognized that:

- living things have changed over time.
- all species were descended from other species.
- organisms were adapted to their environments.

Slide 10 of 27

Lamarck proposed that by selective use or disuse of organs, organisms acquired or lost certain traits during their lifetime. These traits could then be passed on to their offspring. Over time, this process led to change in a species.

> Slide 11 of 27

Tendency Toward Perfection

Lamarck proposed that all organisms have an innate tendency toward complexity and perfection.

They are continually changing and acquiring features that help them live more successfully in their environments.

Slide 12 of 27

Use and Disuse

Lamarck proposed that organisms could alter the size or shape of particular organs by using their bodies in new ways.

Copyright Pearson Prentice Hall

Slide 13 of 27

A male fiddler crab uses its front claw to ward off predators and to attract mates.

Because the front claw is used repeatedly, it becomes larger.

This characteristic (large claw) is passed onto its offspring.

Slide 15 of 27

Inheritance of Acquired Traits

Lamarck thought that acquired characteristics could be inherited.

He believed that if an animal acquired a particular feature in its lifetime, that feature would be passed on to its offspring.

Slide 16 of 27

Evaluating Lamarck's Hypotheses

Lamarck's hypotheses of evolution are incorrect in several ways.

Lamarck did not know:

- how traits are inherited.
- that an organism's behavior has no effect on its heritable characteristics.

However, he paved the way for the work of later biologists.

15–2 Ideas That Shaped **Population Growth** Darwin's Thinking

What was Malthus's theory of population growth?

Copyright Pearson Prentice Hall

Slide 18 of 27 15–2 Ideas That Shaped **Population Growth** Darwin's Thinking

Population Growth

In 1798, Thomas Malthus published a book in which he noted that babies were being born faster than people were dying.

The only forces he observed that worked against this growth were war, famine, and disease.

Slide 19 of 27 15–2 Ideas That Shaped **Population Growth** Darwin's Thinking

Malthus reasoned that if the human population continued to grow unchecked, sooner or later there would be insufficient living space and food for everyone.

Copyright Pearson Prentice Hall

Slide 20 of 27 15–2 Ideas That Shaped **Population Growth** Darwin's Thinking

When Darwin read Malthus's work, he realized that this reasoning applied to plants and animals.

If all the offspring of almost any species survived for several generations, they would overrun the world.

This information was central to Darwin's explanation of evolutionary change.

15-2 Section QUIZ

Copyright Pearson Prentice Hall

Slide 22 of 27

- 1 Hutton and Lyell recognized that geological processes
 - a. of the past differ from those of the present.
- b. indicate that Earth is many millions of years old.
 - c. operate quickly, often over thousands of years.
 - d. always involve violent events like volcanoes, earthquakes, and floods.

Slide 23 of 27

- 2 The discovery of many fossils challenged the idea that
 - a. acquired traits could be inherited.
 - b. Earth is many millions of years old.

d. geological changes are slow.

А

Slide 24 of 27

- 3 Which of the following scientists proposed the hypothesis of selective use and disuse?
 - a. Charles Darwin
- A b. Jean-Baptiste Lamarck
 - c. Thomas Malthus
 - d. Charles Lyell

Slide 25 of 27

15-2 Section QUIZ

- 4 The scientist that proposed that Earth is shaped by geological forces that took place over long periods of time is:
 - a. Malthus

- b. Hutton
- c. Darwin
- d. Lamarck

Slide 26 of 27

- 5 Darwin's reading of Thomas Malthus made him realize that
 - a. because of overpopulation, human beings cannot avoid extinction.
 - b. all living things must evolve.
 - c. living things produce more offspring than can possibly survive.
 - d. the basic ideas of Lamarck were wrong.
