| Westfall   | Name<br>Pd<br>How the Earth Formed                                   |
|--|--|
| 1. Large cloud of  | was transformed into the planet we know today.                       |
| 2. Regions of dust and gas are called hundreds ofac  | clouds. They are vast, cover   |
| 3. Nebulas are made up of  | from dead stars.   |
| 4. When a star dies, it's called a   |  |
| 5 is the force   | that drives creation.  |
| 6. The gas cloud   | under the force of gravity.  |
| 7. The cloud starts to spin  | as the material moves towards the                                    |
| <ul><li>8. The spinning cloud became our</li><li>9. Just like salt or sugar clumping, th charge.</li></ul> | ne dust or gas clumped attracted by it's                             |
| 10. The forming planetsplanets.  | with each other, reducing it to just a few                           |
| <ul><li>11. The early earth would have been existence, plus deadly</li></ul>                               | from the sun would have bombarded the s the Earth at miles per hour. |
| 13 is evidence   | te that the solar wind can strip away an atmosphere.                 |
| 14. The eleme core.  | ents sank to the center of sphere to form the iron                   |
| 15. The spinning action of the core c wind.  | reates a that deflects the solar                                     |

16. The early Earth had no \_\_\_\_\_\_ or \_\_\_\_\_.

17. \_\_\_\_\_turned out to be very dry.

| 18. The moon resulted from a            | with the early Earth that threw                              |
|---|--|
| material into orbit around the Earth.   | The ground remained from                                     |
| years after the impact.                 |  |
| 19. The collision could have also ti    | Ited the Earth on its, which                                 |
| gave us the                             | Without the formation of the moon, we wouldn't               |
|   |  |
|   | did not yet exist.   |
| 21. The water came from the             | where it was frozen.   |
| 22. Meteorites contain                  | minerals, which trap water molecules.                        |
| As you move farther from the sun, t     | he meteorites contain water.                                 |
| 23. As cras                             | shed to Earth, they exploded and released their water.       |
| 24. We think water arrived in about     | c  |
| 25. The sea was full of                 | , which would have appeared                                  |
| , and the atn                           | nosphere would have had a reddish tinge.                     |
|   |  |
| 26. Still at this point, there was no _ | in the atmosphere to breathe.                                |
| 27 Stromatalitas and mimitive life      | forms of Thorizon mode of                                    |
| blue group besteries and photosynthe    | forms of They're made of esize, giving off in the            |
| process.                                | esize, giving on in the                                      |
| process.                                |  |
| 28. Stromatolites are 15 times older    | than the .   |
|   |  |
|   | of the oxygen they produced was converted to rust            |
| that out and                            | turned into rock.  |
| 29. Then the oxygen levels started t    | to rise to higher levels due to                              |
| 29. Then the oxygen levels started i    | .o fise to higher levels due to                              |
| 30. To sum it up, so the water came     | e from colliding with the                                    |
| Earth, and the oxygen came from         | photosynthesizing. The                                       |
| collision that formed the               | photosynthesizing. Thetilted the Earth, and gave us seasons. |
